

Session Catalog — 2026-06-20

Complete record of everything done this session: shipped changes, bugs found, fixes, open items, and candid misfires. 15 commits (10 code + 5 docs), all pushed to `master` and live on mycaddipro.com. Companion docs: [FUCKUPS.md](#) (bug ledger), [progress.md](#) (dated diary).

1. Commits (newest → oldest)

Commit	Type	What
33b648a7	docs	Log caddy/back-button fixes + correction (caddy_profiles is demo)
26d9c133	fix	My Caddies: show only the golfer's own caddies, hide the demo directory
331236bb	revert	Revert caddies default to 'notebook' (my change had surfaced demo data)
7cbdab61	fix	Back button: dashboard box links push nav history (showGolferTab)
ecea9347	fix→reverted	Caddies tab default → 'All Caddies' (wrong — surfaced demo; reverted)
07da39c3	docs	Log mobile fix, descriptions→data, event-source + box rollover
10c52fb1	feat	Today's Tee Time box: show current event, roll to next once it passes
b2fc25b6	fix	Golfer cubes: wire upcoming rounds to event registrations (not tee bookings)
c9a8f2b4	feat	Golfer cubes: drop descriptions, fill that space with live data (keep Play Golf)
0a0f0d3f	fix	Golfer cubes: show live-info pills on MOBILE geekout view
7bb1ae96	docs	Log golfer cube live-info work
8f18b85d	feat	Golfer dashboard: live info on overview cubes + group/weather on tee box
8fa1635d	docs	MyCaddiPro design-system brief (Option A — tokens + conventions)
e05b258e	docs	Catalog phantom-activity bug + related fuck-ups (FUCKUPS.md #1)

Commit	Type	What
69ef2ddb	fix	Fix phantom user activity: base 'last active' on real logins, not updated_at

2. Work by area

A. Admin — phantom "active users" (69ef2ddb)

- **Bug:** the User Activity panel used `user_profiles.updated_at` as "last active." A global handicap update bumped 9 users' `updated_at` to the same instant → all showed "Online/active today." Proven in DB.
- **Fix:** added `user_profiles.last_login_at ; recordUserLogin()` stamps it once per session on dashboard entry; "true last active" = `max(login, last round, last event)` — never `updated_at`.
- Full writeup: FUCKUPS.md #1.

B. Design system brief (8fa1635d)

- claude.ai/design produced a poor golfer dashboard; `/design-sync` doesn't apply (MciPro is a monolithic vanilla app, no component library). Built **Option A:** `project-memory/DESIGN-SYSTEM.md` — a tokens + conventions brief (real Tailwind classes from the code) that doubles as a claude.ai/design prompt.
- Key fact: MciPro has **no custom design tokens** — stock Tailwind via CDN + brand conventions.

C. Golfer overview cubes — live info (8f18b85d , 0a0f0d3f , c9a8f2b4 , b2fc25b6)

- **GolferCubeInfo module** binds each overview cube to its live data (kept the existing cube design; Pete rejected a restyle). Defensive — only overwrites a pill when it has real data; falls back to the original label otherwise (zero regression risk).
- **Mobile fix (0a0f0d3f):** mobile CSS hid `.mt-2` pills (`display:none`) so the info was invisible on phones. Tagged live pills `.cube-live` and showed those on mobile; empty cubes stay compact.
- **Descriptions → data (c9a8f2b4):** removed cube subtitle descriptions, every cube shows a data line (with empty states); Play Golf kept its CTA.
- **Correct data source (b2fc25b6):** cubes initially read tee-time *bookings* + the new-events badge → showed "No upcoming." Pete's rounds are **society-event registrations**. `loadEvents()` now queries `event_registrations` → `society_events`: Tee Time = next event, Society = "N upcoming", Caddy = "Caddy #".
- Sources also wired: rounds count + best (rounds table), live weather (Open-Meteo).

D. Today's Tee Time box — rollover (10c52fb1)

- Per Pete: show the **current event**, and once its time passes roll to the **next upcoming**.
- `renderTeeBox()` fills the box from the same event source (course, tee + departure, caddy, weather); title switches "Today's Tee Time" ⇌ "Next Round"; ~5h grace keeps the round visible while in progress.

E. Caddies + back button (7cbdab61 , 26d9c133 ; ecea9347 → 331236bb reverted)

- **Back button (7cbdab61)**: box links ("Schedule →", "Book Caddy →", "View All →") used `TabManager.showTab` which doesn't push `NavHistory` → the universal back button stayed hidden. Switched to `showGolferTab` (pushes history).
- **My Caddies demo (26d9c133)**: `caddy_profiles` (128) is **seed/demo** data. Per Pete, demo caddies belong only in the Caddy BOOKING module — "My Caddies" must show only the golfer's OWN caddies. `CaddyOrganizerSystem.loadCaddies()` now starts `allCaddies=[]` and merges only `notebook` + `caddy_bookings`
 - `event_registrations.caddy_numbers` . Verified: Pete = 73 real caddies, zero demo. Also resolved the "Siam caddies under Pattaya CC" complaint (no demo left in the module to mis-bucket).

3. Open / not done

- **normalizeCourse() greedy match (booking module)**: `lower.includes('pattaya')` buckets "Siam Country Club (Pattaya Old Course)" as 'Pattaya CC' (fires before the `siam && old` rule). My Caddies is fixed (demo removed); the BOOKING module would still mis-bucket real Siam caddies. Fix = `&& !lower.includes('siam')` on the pattaya line (3 copies across caddy modules). **Not done.**
- **Schedule tab is empty (#golfer-schedule)**: it reads tee-time bookings, not event registrations — same root cause as the cubes. Pete's event rounds don't show there. **Not wired.**
- **Caddy data is demo-only**: there are no real caddies populated anywhere; event-number caddies show as "Caddy #84" with no rating/bio. Enriching them (or loading real caddy data) is a data task, pending Pete.
- **Activity/History edge**: History best-score keys on `rounds.golfer_id = lineUserId`; player-id fragmentation could undercount. Course-admin "Last Login" field still always "Never" (dead read).

4. Misfires (own them — see progress.md for detail)

1. Spent several rounds designing fictional dashboards before realizing Pete wanted his REAL screen improved.

2. Wired cube info to the wrong data source (tee bookings vs event registrations) until told to "check the registrations."
3. "Fixed" My Caddies by surfacing the demo directory, and edited a caddy module without confirming it was the right one of ~5 — violating the documented "confirm the render path first" lesson. Reverted, then fixed correctly.
4. Flip-flopped the caddies `currentFilter` default (notebook→all→notebook→all).

5. Verification method that worked (reuse this)

Serve `public/` locally (`python3 -m http.server 8889`), drive via agent-browser, jump the login wall with `ScreenManager.showScreen('golferDashboard')` , and **set**

`AppState.currentUser.lineUserId` to the real id (`U2b6d976f19bca4b2f4374ae0e10ed873`) so the local app queries the **real Supabase** — confirms wiring against live data without LINE login. Always **cache-bust the URL** (`?cb=<ts>`) or Chrome serves stale HTML. Mobile: `agent-browser set device "iPhone 14"` . Verified the deploy is live by curling `mycaddipro.com`.
